

Study Show Periodontal Disease is Linked With Multiple Life Threatening Systemic Diseases...

Studies suggest that gum disease may be a risk factor in causing other diseases throughout the rest of your body. It has been proven that the same bacterial types found in gum disease have been also found in the coronary arteries of the heart with partial blockage or "plague" buildup. Gum disease is also responsible for worsening the conditions of diabetes, arthritis, certain cancers, and even alzheimer's.

The chronic periodontal infection can spread to areas other than the mouth. Tooth brushing, flossing and regular dental checkups are essential in keeping these factors under control. And again, your overall health is definitely effected by your oral health.

Warning Signs:

Red Swollen Bleeding Gums Pain in Your Mouth Gingivitis/Bad Breath/Bad Taste Painful Chewing/ Teeth Sensitivity Loose Teeth

If you are experiencing any of these symptoms or you are due for a cleaning call today and schedule your appointment.
